

HAMED AYOJIDE .A

DevOps Engineer | CI/CD Automation | Cloud Infrastructure | Kubernetes

+2347045459124 | hamedayojide58@gmail.com | [LinkedIn](#) | [GitHub](#)

PROFESSIONAL SUMMARY

DevOps Engineer with 4+ years of hands-on production experience designing and maintaining CI/CD pipelines, provisioning cloud infrastructure with Terraform and Ansible, and deploying containerised microservices on Kubernetes (EKS/ECS). Proven ability to bridge the gap between development and operations by driving automation, scalability, and reliability across AWS environments. Skilled in Python and Bash scripting, with a strong track record of integrating DevSecOps practices into delivery pipelines, setting up Prometheus/Grafana observability stacks, and enabling teams to ship faster with fewer incidents.

PROFESSIONAL EXPERIENCE

DevOps Engineer

HNG-Tech — Remote | Jan 2025 – Apr 2025

- Closely monitored system health, performance, and availability using Prometheus and Grafana; implemented alerting rules that reduced production downtime by 60% through proactive incident detection.
- Responded to and resolved production incidents as Level 2 support; led post-incident root cause analysis (RCA) sessions, documenting findings and implementing preventive actions to eliminate recurring failures.
- Wrote Python and Bash automation scripts for operational tasks including deployments, environment bootstrapping, and recovery procedures, significantly reducing manual toil.
- Provisioned and managed AWS infrastructure with Terraform (ECS, EKS, RDS, Route53, IAM, multi-account), implementing IaC principles for consistent, reproducible environments - reducing setup time by 50%.
- Optimized CI/CD pipelines for microservices using GitHub Actions, ArgoCD, and Helm, accelerating release cycles by 45% and enabling safer, more reliable deployments.
- Automated FastAPI deployments to EC2 with Ansible and GitHub workflows, improving release efficiency by 35% and enforcing security best practices across environments.
- Collaborated with software teams to define reliability standards and drive automation best practices, boosting overall team efficiency by 30%.

Cloud Intern / DevOps Associate

Altschool Africa — Remote | Jun 2023 – Aug 2024

- Implemented Prometheus/Grafana monitoring across infrastructure, cutting incident response time by 35% through real-time observability and automated alerting.
- Automated patching, backups, and system audits using Bash and cron, reducing manual operational overhead and keeping systems consistently up-to-date and recoverable.
- Optimized Linux server performance through kernel tuning, iptables configuration, and sysctl adjustments, reducing CPU and memory bottlenecks by 30%.
- Provisioned AWS infrastructure with Terraform and configured Linux servers with Ansible for consistent, automated multi-environment deployments.
- Deployed microservices on EKS and ECS using GitHub Actions CI/CD, improving rollout reliability and deployment speed by 40%.
- Contributed to Terraform module development and infrastructure security reviews, strengthening compliance and reducing configuration drift.

Freelance Cloud & DevOps Engineer

NimbusStack Solutions (Healthcare Client) — Remote | Jun 2019 – May 2022

- Maintained 99.95% system uptime for a HIPAA-compliant healthcare platform by leading migration from a monolithic architecture to fault-tolerant microservices on AWS with native autoscaling.
- Built and integrated a full observability stack (Prometheus, Loki, Grafana), achieving 40% faster incident response through real-time alerting, log aggregation, and performance tracing.
- Implemented chaos engineering and failover testing via Python and Bash scripts, validating system resilience and ensuring automated recovery under failure conditions.

- Reduced infrastructure provisioning time by 80% using Terraform IaC, enabling reproducible, version-controlled environments with automated rollback capabilities.
- Built secure CI/CD pipelines with GitHub Actions and GitLab CI, cutting release cycles from 2 weeks to 2 days while integrating automated security checks (DevSecOps).
- Containerized services with Docker and deployed to EKS with managed node groups and autoscaling, significantly improving scalability and system self-healing.

KEY PROJECTS

Blue-Green Deployment Pipeline — AWS ECS (Fargate)

- Engineered a zero-downtime blue-green deployment strategy on AWS ECS (Fargate) using Terraform and GitLab CI, with automated rollbacks triggered by failed health checks — reducing deployment incidents by 80% and maintaining 99.9% availability

Sock-Shop Microservices Web App — AWS EKS

- Deployed a production-grade microservices application on AWS EKS with Kubernetes manifests, integrating Prometheus and Grafana for real-time SLO monitoring and auto-recovery — improving deployment frequency by 60% and reducing downtime by 75%.

AI-Driven CI/CD Architecture

- Designed a self-healing, feedback-driven CI/CD pipeline integrating automated code testing, error handling, and production promotion with Kubernetes orchestration — reducing deployment downtime by 80% and accelerating development cycles by 70%.

Linux Backup & Recovery Automation

- Developed automated Bash/Python scripts for system backups, software updates, disk usage monitoring, and proactive resource management — reducing manual intervention by 90% and ensuring minimal downtime across Linux server fleets.

CORE TECHNICAL SKILLS

Monitoring & Observability: Prometheus, Grafana, Loki, ELK Stack, Alertmanager — real-time alerting, dashboards, SLO tracking

Cloud Platforms: AWS (EC2, ECS, EKS, S3, RDS, Route53, IAM, ElastiCache, CloudFormation) | GCP

Infrastructure as Code: Terraform, Ansible, AWS CloudFormation — multi-env, version-controlled provisioning

Containers & Orchestration: Docker, Docker Compose, Kubernetes (EKS, ECS) - autoscaling, self-healing, managed node groups

CI/CD Pipelines: GitHub Actions, GitLab CI, Jenkins, ArgoCD, Helm, Drone, Travis CI

Scripting & Automation: Python (TDD), Bash, YAML- operational automation, recovery scripts, patching, backups

Security & Networking: IAM, VPC, VPNs, SSL/TLS, DNS, TCP/IP, Subnetting, HashiCorp Vault, DevSecOps

Databases & Messaging: PostgreSQL, MySQL, MongoDB, Redis, Kafka — performance tuning and reliability

Linux Administration: Kernel tuning, iptables, systemctl, performance optimization, cron automation

EDUCATION & CERTIFICATIONS

Diploma in Cloud Engineering — Altschool Africa (2023)

HNG Certificate of Proficiency — HNG-Tech (2025)
